Quiz: Module 1, Lesson 1.1 - What is AI Automation & Why It Matters

Questions

Question 1

What is the key difference between AI automation and traditional automation?

A) AI automation is more expensive to implement B) AI automation can understand context and adapt, while traditional automation follows rigid rules C) Traditional automation requires less technical knowledge D) There is no significant difference

Question 2

Which of the following is NOT a benefit of AI automation mentioned in the lesson?

A) 24/7 operation without human intervention B) The ability to scale your capabilities without scaling your hours C) Guaranteed success in any business venture D) Competitive advantage through early adoption

Question 3

According to the lesson, what is currently unique about the AI automation landscape?

A) AI automation is only available to large enterprises B) All the necessary tools are available for free or at low cost C) AI automation is already standardized across all industries D) No one is using AI automation yet

Question 4

What are the key hardware requirements mentioned for running AI automation?

A) A supercomputer and expensive GPU cluster B) A computer, internet connection, time to learn, and willingness to experiment C) A minimum of $10,000 in equipment D) A dedicated server room with climate control

Question 5

The lesson suggests that AI automation CAN do all of the following EXCEPT:

A) Handle repetitive tasks with consistency B) Process large amounts of information quickly C) Replace human judgment on complex decisions D) Maintain 24/7 availability for routine interactions

---

Answers

Question 1: B AI automation can understand context and adapt to new situations, while traditional automation follows predefined, rigid rules. This contextual understanding allows AI automation to handle ambiguity and make decisions based on circumstances.

Question 2: C The lesson does not claim that AI automation guarantees success in any business venture. It mentions benefits like 24/7 operation, leverage (scaling capabilities without scaling hours), and competitive advantage, but success still depends on proper implementation and business fundamentals.

Question 3: B The lesson emphasizes that we're in a unique window of time where the tools needed for AI automation are available for free or at low cost. This democratization means individuals and small businesses can access capabilities that were previously only available to large enterprises.

Question 4: B The lesson states that the barriers to entry are remarkably low: a computer, internet connection, time to learn, and willingness to experiment. No enterprise budget, IT department, or computer science degree is required.

Question 5: C The lesson explicitly states that AI automation cannot (yet) replace human judgment on complex decisions. It can handle repetitive tasks, process information quickly, and maintain 24/7 availability, but complex judgment remains a human capability.
