Quiz: Module 1, Lesson 1.3

Questions

Question 1

What is the minimum RAM recommended for running AI models comfortably?

A) 4GB B) 8GB C) 16GB D) 32GB

Question 2

What advantage do Mac computers with Apple Silicon (M1/M2/M3/M4) have for AI?

A) They are less expensive than other computers B) Unified Memory Architecture allows efficient CPU/GPU sharing C) They come with AI pre-installed D) They have better cooling systems

Question 3

What should you do if you have limited hardware (8GB RAM, no GPU)?

A) Give up on running AI locally B) Use smaller, quantized models that run efficiently on CPU C) Buy expensive new hardware immediately D) Only use cloud-based AI services

Question 4

What is the 'good enough' philosophy for hardware?

A) You need the best hardware available B) You need hardware that gets the job done, not necessarily optimal C) Performance is the only thing that matters D) You should never compromise on hardware

Question 5

What is the most important hardware specification for running AI models?

A) CPU speed B) RAM (memory) C) Storage space D) Monitor size

---

Answers

Question 1: B 8GB is the minimum recommended RAM, though 16GB is recommended for comfortable operation with most models.

Question 2: B Apple Silicon's Unified Memory Architecture allows the processor to share memory efficiently between CPU and GPU tasks, enabling AI performance that would require a dedicated GPU on other systems.

Question 3: B With limited hardware, you should use smaller, quantized models (like phi3 or tinyllama) that run efficiently on CPU without requiring a GPU.

Question 4: B The 'good enough' philosophy recognizes that you need hardware that works and gets the job done, not necessarily the most powerful or optimal hardware available.

Question 5: B RAM is the most important specification because AI models need to be loaded into memory. More RAM allows you to run larger, more capable models.
