Quiz: Module 1, Lesson 1.4

Questions

Question 1

What is the fundamental difference between a chatbot and an AI agent?

A) Chatbots are more expensive than AI agents B) AI agents can take autonomous action while chatbots just converse C) Chatbots have better memory than AI agents D) There is no difference, they are the same thing

Question 2

What is an example of something an AI agent can do that a chatbot cannot?

A) Have a conversation about a topic B) Read your emails, access your calendar, and take action on your behalf C) Generate text responses to questions D) Provide customer service responses

Question 3

Why does the lesson emphasize that 'the future is agentic'?

A) Because chatbots are becoming obsolete B) AI is moving from conversational to operational, and early adopters gain advantage C) All AI will eventually be agents D) Agents are cheaper than chatbots

Question 4

How does OpenClaw exemplify the agent approach described in the lesson?

A) It's just a chatbot with extra features B) It's built as an agent from the ground up with memory, tools, and autonomy C) It can only have conversations D) It requires constant human oversight

Question 5

What should you expect when transitioning from chatbot to agent thinking?

A) Immediate productivity without any learning curve B) A learning period where you build trust and understand capabilities C) No change in thinking required D) Agents will immediately replace all human work

---

Answers

Question 1: B The fundamental difference is that AI agents can take autonomous action - they can access tools, execute operations, and work independently - while chatbots only converse.

Question 2: B AI agents can access your tools and take action - like reading emails, checking calendars, and executing operations - while chatbots can only have conversations.

Question 3: B AI is evolving from conversational (chatbots) to operational (agents). Early adopters who understand and use agents now will have compounding advantages.

Question 4: B OpenClaw is built as an agent from the ground up with persistent memory, tool integrations, autonomous operation capabilities, and multi-agent support - not just chat with features added on.

Question 5: B Transitioning to agent thinking requires a learning period where you build trust with your agent, understand its capabilities, and develop effective working patterns.
