Quiz: Module 1, Lesson 1.5

Questions

Question 1

What is the key mindset shift required for effective automation?

A) Working faster to complete more tasks B) Asking ‘How can a system handle this?’ instead of ‘How do I do this?’ C) Hiring more people to handle workload D) Ignoring tasks that seem too complex

Question 2

When should you automate a task versus doing it manually?

A) Automate everything possible to save maximum time B) Automate repetitive, well-defined tasks; do manually for one-time or nuanced tasks C) Never automate anything that could be done manually D) Automate only tasks you dislike doing

Question 3

What is the ‘investment curve’ concept mentioned in the lesson?

A) Investing money always leads to success B) Automation costs time now but saves time later as volume increases C) You should never invest time in automation D) The more you invest, the less you save

Question 4

Which of the following is an example of system-oriented thinking?

A) Answering each email as it comes in individually B) Creating an email system that categorizes, drafts responses, and flags urgent items C) Handling every customer request personally D) Doing tasks the same way every time

Question 5

What is a common barrier to adopting the automation mindset?

A) Having too much free time B) The belief that ‘it’s faster to just do it myself’ C) Having too much automation experience D) Working on repetitive tasks

---

Answers

Question 1: B The key shift is moving from asking ‘How do I do this task?’ to asking ‘How can a system handle this for me?’ - focusing on systems rather than tasks.

Question 2: B You should automate repetitive, well-defined tasks that happen frequently and have clear decision criteria. Do manually tasks that are one-time, undefined, or require nuanced judgment.

Question 3: B The investment curve shows that automation costs time upfront but saves time as volume increases. Eventually, automated systems require zero additional time per task.

Question 4: B System-oriented thinking means creating processes that handle tasks automatically - like an email system that processes, categorizes, and responds - rather than handling each item manually.

Question 5: B The belief that ‘it’s faster to just do it myself’ is a common barrier. While true for the first instance, automation saves time over the lifetime of a task.
