Quiz: Module 5, Lesson 5.1 - Why One Agent Isn’t Enough

Questions

Question 1

What is the “generalist problem” with single-agent systems?

A) They’re too expensive B) They can do many things but can’t specialize in any C) They’re too slow D) They can’t connect to the internet

Question 2

What is an example of the “context problem” with single agents?

A) The agent forgets everything B) Different domains need different context (work vs. personal vs. creative) C) The agent is always in the wrong timezone D) The agent speaks multiple languages

Question 3

What is the main benefit of multi-agent systems?

A) They cost more to run B) Each agent can specialize and be optimized for its domain C) They require more configuration D) They’re harder to manage

Question 4

When is a single agent sufficient?

A) Never - you always need multiple agents B) When you’re just getting started, have simple needs, work in one domain, or have low volume C) When you have complex needs D) When you have a large budget

Question 5

What is the recommended transition path from single to multi-agent?

A) Jump directly to 10 agents B) Go from single to dual, then to multi-agent as needs grow C) Hire a consultant to set up agents D) Only use multi-agent for enterprise

---

Answers

Question 1: B The generalist problem is that a single agent tries to be everything and ends up generic - good at many things but not excellent at any specific domain.

Question 2: B Different domains need different context - work context, creative context, personal context - and a single agent can't easily switch between them without confusion.

Question 3: B In multi-agent systems, each agent can be specialized and optimized for its specific domain, providing better performance in each area.

Question 4: B A single agent is sufficient when you're just learning, have simple needs, work in a single domain, or have low volume of requests.

Question 5: B The recommended transition is gradual: start with a single agent, add a second specialized agent when needed, then expand to multi-agent as your needs grow.
